NSK launches Prokit

Prokit from NSK is a new range of products for the aftermarket. It guarantees only 100% genuine bearings, seals and fasteners, as used by OE manufacturers.

As a global leader on the production of hub bearings for most of the world's car brands, NSK has a deep understanding and experience of the requirements for quality and specification. NSK brings these products and expertise to the aftermarket, giving confidence to installers on the parts they fit to customer's cars. The quality and reliability provided to the main car brands is now available in your garage.

Carbon Clean add new small unit

Carbon Clean, the engine decarbonising system that works on tap water, has launched a new compact CC-14 machine to complement the existing CC-16 unit.

Both machines use electrolysis-based cleaning technology to remove carbon deposits in engines which can cause loss of power, increased fuel consumption and more wear to engine components.

The CC-14 Carbon Clean machine breaks water down into an oxyhydrogen (HHO) gas mixture which is then blown into the engine to accelerate combustion and clear residues.

CC-14 uses 1.3 kW of power to produce 600 litres per hour of HHO. It measures just 65cm x 35cm x 86cm and weighs only 30 kg.

It is ideal for smaller engines and offers a 'walk-away' capability thanks to its automated process controls that shut down the machine once a job is completed. The CAMS failsafe safety cut-out ensures the machine will automatically shut down to prevent any gas escaping if the engine stops during the cleaning process too.

Carbon Clean have recently completed a series of successful shows, culminating in Automechanika Birmingham 2017.

Dayco - Power transmission specialist

Highlighting Dayco's High Tenacity and HK belts demonstrates how the company is developing technology to improve

performance of individual components and subsequently the drive system as a whole. Despite growing numbers of vehicles being fitted with High Tenacity (HT) timing belts as OE, technicians may not be aware that all OE HT belts are manufactured by Dayco.

It is Dayco that developed the twin spiralled glass-fibre cord technology which is wound into the core of these belts. This gives the incredible tensional strength, and provides the patented PTFE/cotton fabric coating on the teeth that reduces friction and pulley wear. It also gives the HT belt its instantly recognisable appearance.

Meanwhile, Dayco HK belts feature a new tooth lining fabric and weave that incorporates aramid fibres. These are now appearing in the aftermarket and are included in specific timing belt and water pump kit applications, with the HK suffix in their marking.

The combination of guaranteed OE quality products, relevant technical expertise and product support, such as the Long Life +1 year warranty, makes Dayco the first choice for discerning professionals.
